Build, Release, Run

Strictly separate build and run stages.

~10 FACTOR PHP APP

env configs + code from repo
 + dependencies + build tasks → Build

php-fpm + nginx/apache   → Run

📋 Run tasks (lessc → css, compress js, etc)

⚛️ Make an Atomic Release

🎇 Install dependencies with composer

Processes

Execute the app as one or more stateless processes.

~10 FACTOR PHP APP

- In PHP each request is handled by a different process.

- Always keep in mind that the next request for a given user might go to another server.
